

Aide

Work you can hear.

A voice-native employment platform for blind and visually impaired workers in Nigeria: find work, prove skill, get paid, withdraw, all by voice.

aide-ng.vercel.app

Live · open in Chrome and just talk

— THE PROBLEM

The web was built for eyes. Money most of all.

Sign-up forms, dashboards, bank apps. Almost all of it assumes you can see a screen and tap a target, with accessibility bolted on afterward, if at all.

*It's not one broken step. A survey of ten major Nigerian banking apps by the **Association for the Blind in Nigeria** found **most unusable** for blind users altogether: unlabeled buttons, dead navigation, and OTP tokens that were never made speech-enabled in the first place.*

~~4 8 2 9 1 7~~

One broken step among many.

In Nigeria, blindness is a poverty condition.

Prevalence of blindness by household wealth · Nigeria National Blindness & Visual Impairment Survey ($p = 0.001$). 1 million blind adults, 3 million more visually impaired.

The loop: *poverty drives avoidable blindness through lack of access to care, and blindness then locks you out of earning, which deepens the poverty. The people the OTP shuts out of digital work are disproportionately the people who most need the work.*

Aide breaks the loop at the earning step.

— THE SOLUTION

The whole earn-to-paid loop, spoken.

01

Find work

"Find me transcription jobs over twelve thousand." Aide filters and reads the matches aloud.

02

Prove the skill

A spoken assessment, graded on the server. The answer key never leaves it.

03

Get paid

A real bank account, issued by Monnify. Aide announces money the moment it lands.

04

Withdraw

The destination is verified, then a spoken phrase authorizes the transfer.

*She speaks; Aide does the rest. **No form, no screen, no code to read.** The interface is a conversation.*

— THE SOLUTION

From "I need work" to money in her own bank account, without ever touching a screen.

AIDE

"Good news. Twelve thousand naira just landed from Grace Adeyemi."

She didn't refresh, didn't check a screen, didn't read a notification. Her phone simply told her.
This is the feature a sighted user never notices and a blind user cannot live without.

— LIVE DEMO

No slide can prove a voice call works. **So we won't try.**

Everything from here is happening live: Aide, listening, in this room, right now.

Open in Chrome and just talk

One interface excludes them all: the one that assumes you can read.

Financially excluded adults

Concentrated in the same low-literacy communities. **Source: EFinA A2F 2023**

Voice-native finance for everyone the screen leaves out. Every one of them can already talk.

The same voice interface serves anyone who can't read a screen, not only blind users. And audio-native work like transcription and low-resource-language AI annotation pays in dollars, while our costs sit in naira.

— BUSINESS VIABILITY

Free to join. Four ways to earn. Nobody pays before they earn.

Transaction fee	10% blended, split 5% employer and 5% worker. Deducted only from completed gigs. Free for the first six months to build liquidity.
Managed hiring	Our margin engine. Employers pay Aide to run the whole selection process: source, assess, shortlist. ₦25,000 to ₦40,000 per hire , or ₦150,000 /month unlimited for volume hirers. Transaction fee waived for these customers.
Direct reach	Employers pay to message verified candidates directly, instead of waiting on applications.
Aide Plus	₦500 /month, optional, for workers: direct messaging to employers and priority matching. Applying stays free and unlimited for everyone. Free for anyone who completes a verified assessment.
Why it works	We don't tax hiring, we do the hiring, and screening is the expensive part employers gladly hand off. Workers never pay a signup fee, an application cost, or a withdrawal charge. They only ever pay out of money they've already earned.

— HOW IT'S BUILT

Every naira Aide speaks is real.

RECEIVE

A real account, per worker

Each user gets their own dedicated Monnify bank account to be paid into.

CONFIRM

Counted only when paid

The balance is the sum of payments Monnify has confirmed, never an optimistic guess.

VERIFY

The name, checked first

Before a kobo moves, Aide reads back the real destination account name.

PAY OUT

A real transfer, by voice

Withdrawals run as live disbursements, authorized by a spoken phrase.

Aide is built on Monnify end to end: receive, confirm, verify, pay. The money is never a demo number.

— HOW IT'S BUILT

Designed from the need out, not retrofitted.

Atkinson Hyperlegible

Commissioned by the Braille Institute. It exaggerates the differences between the glyphs low-vision readers confuse (I/l/1, O/0, b/d), which matters most for account numbers and amounts.

Aa

Il1

O0

bd

Never color alone

Every status is also stated in text and shape, so nothing is lost to color blindness or a screen reader.

Okabe-Ito, AAA contrast

The colorblind-safe standard palette, every foreground $\geq 7:1$ on paper. No red/green pair ever carries meaning on its own.

Body text 15.8:1 • Actions 7.3:1

Large by default

18px base, 48px targets, warm off-white ground that reduces the glare which triggers photophobia, with no zoom control to hunt for.

— THE TEAM

Meet our team.
